

Configure and Deploy SSIS Packages

Thomas LeBlanc

DATA WAREHOUSE ARCHITECT

@TheSmilingDBA www.Thomas-LeBlanc.com

Agenda

Deploying SSIS solutions

Creating environments and mapping

Executing package with an environment

Deploying SSIS Solutions

Deployments

Project – parameters, connections, and packages

Individual package – version increased but faster than whole project

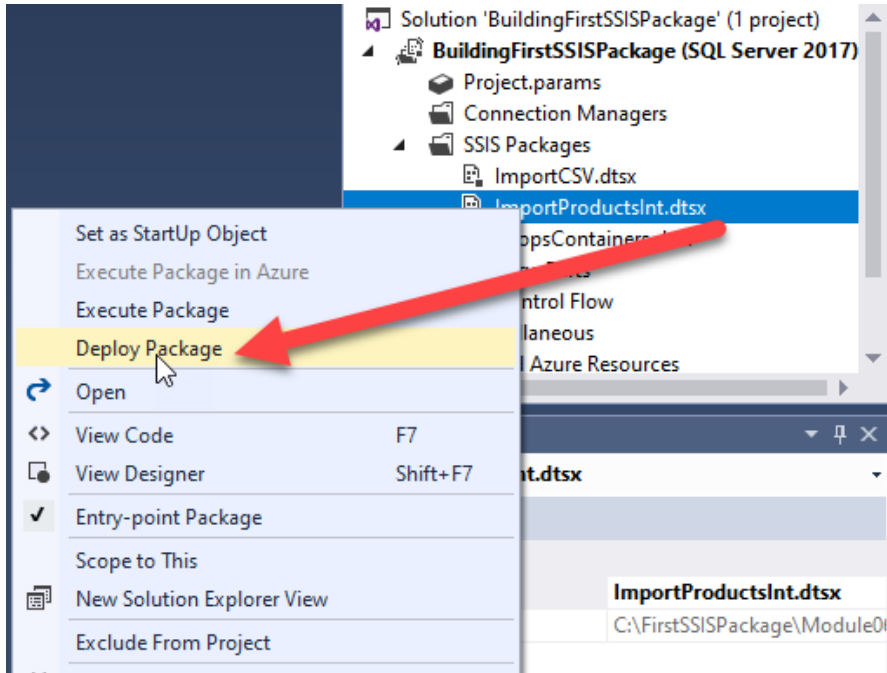

History is retained

Versions are incremental – last 10 by default

Deploy project

Deploy package

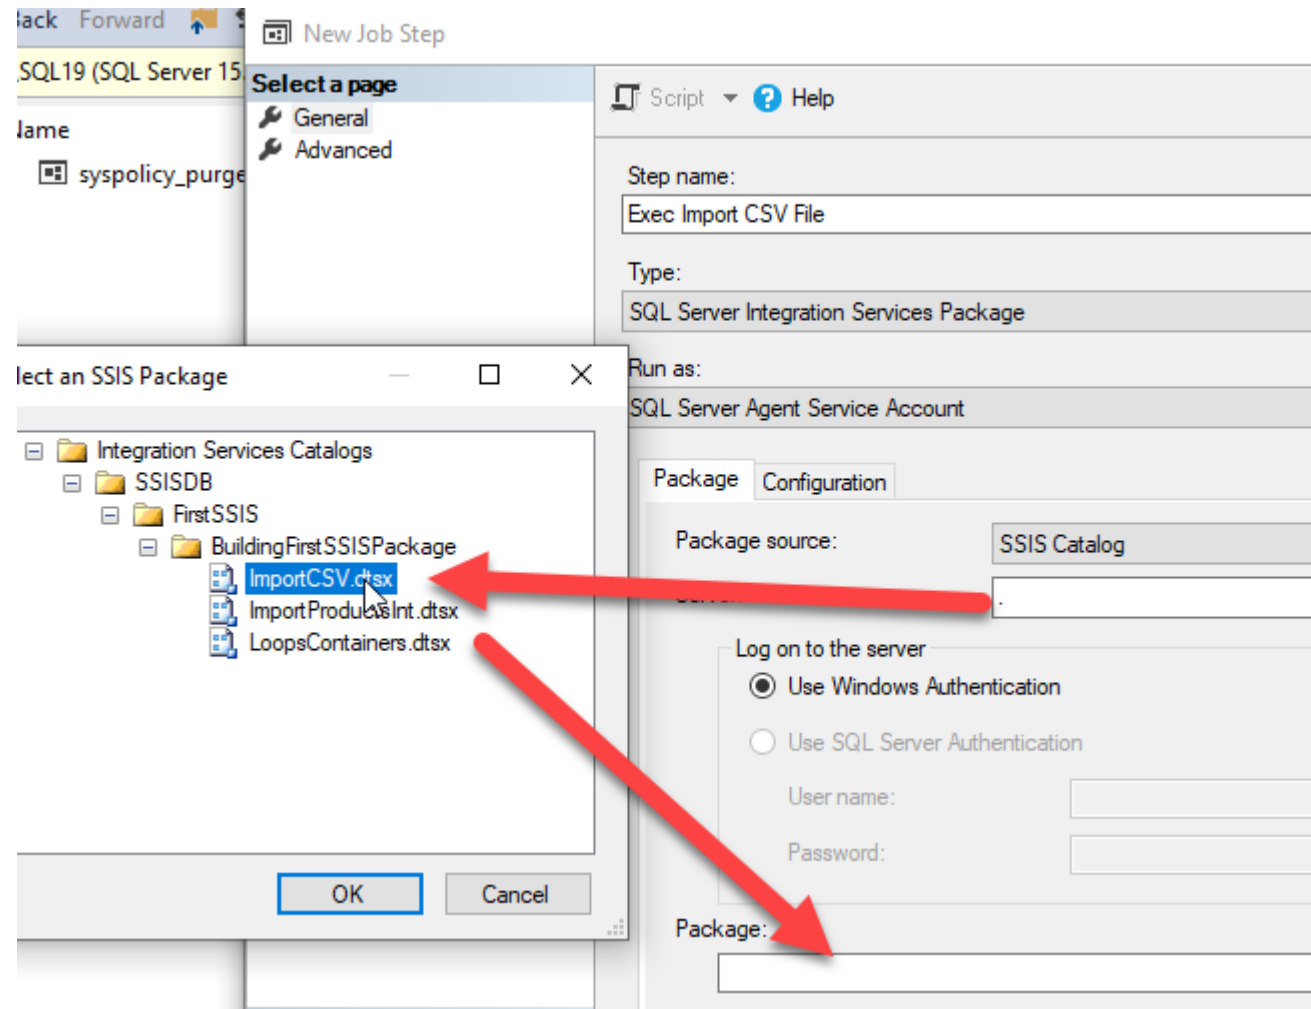

Catalog has versions

Revert to previous version

- Not source control
- Not linked to environment
- Uses defaults in package

Executing...
...SSMS
...SQL Server Agent

Demo

Execute a package in SQL Server Agent

Creating Environments and Mapping

Environments

Dev

Local development on a laptop

QA

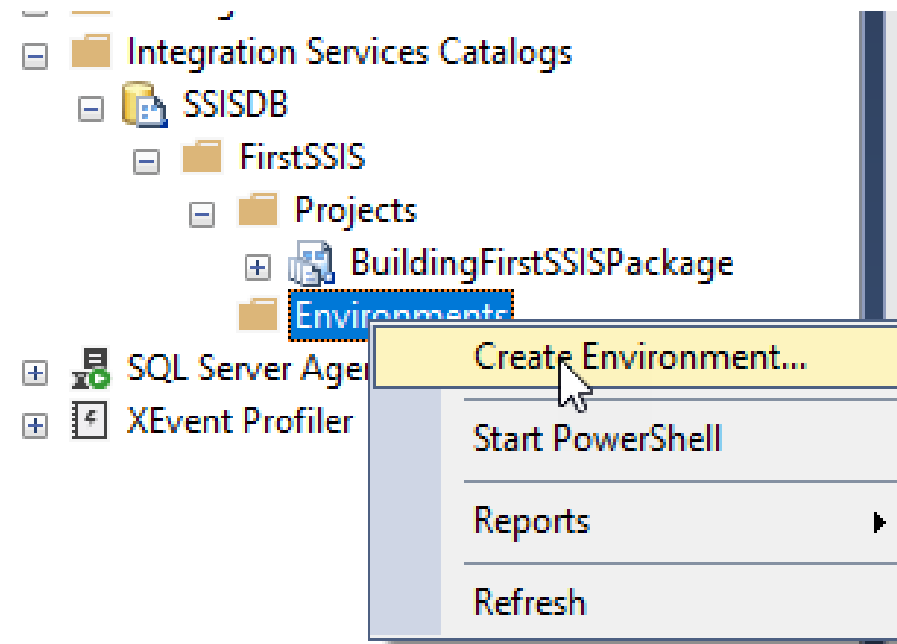

Testing for quality assurance or quality control

Prod

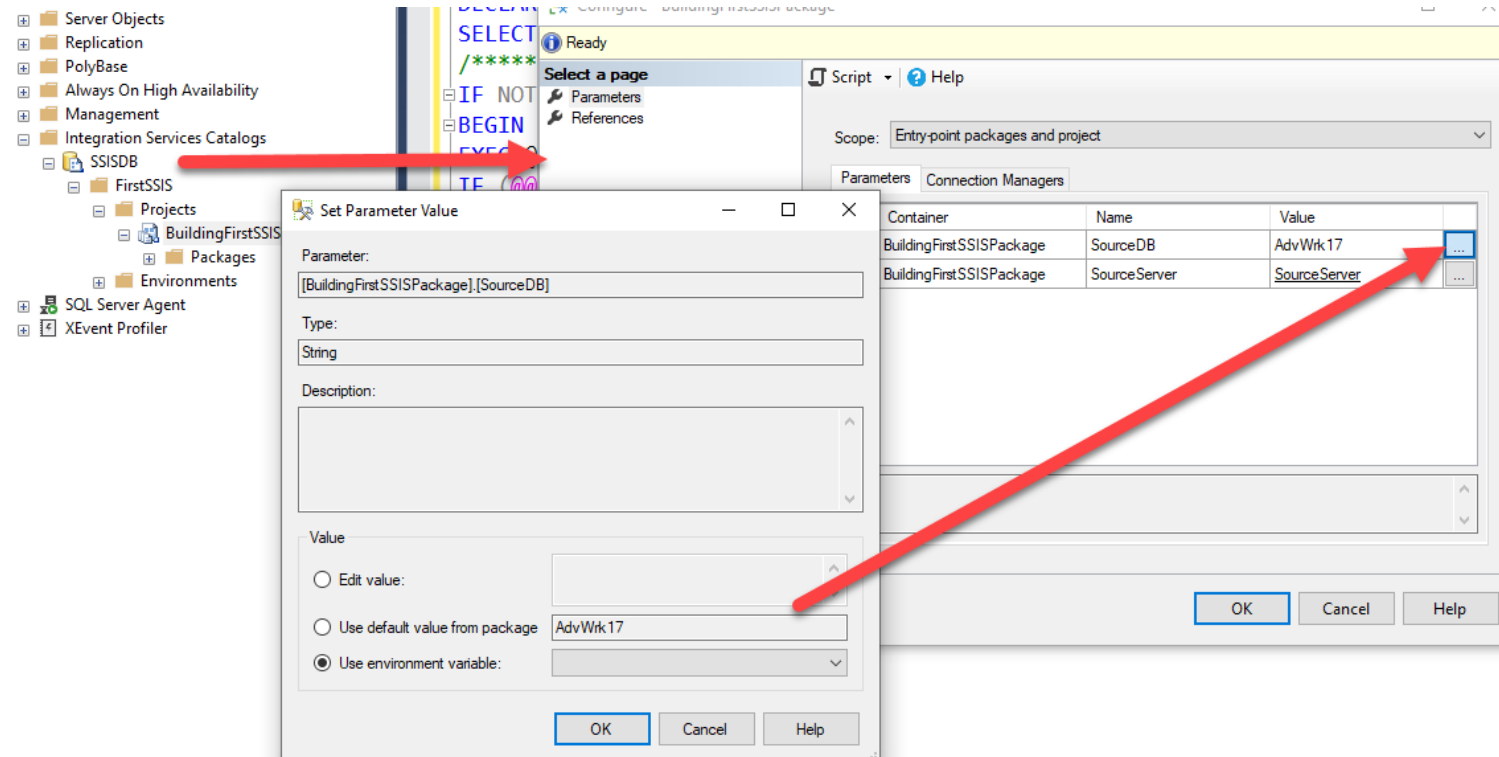

Production deployment for business

Values for parameters
Connection to sources
Used in expressions
Separate deployments

Relate environments
Select project parameters
Map parameter
Select in execution

Demo

Setup and map an environment

Executing Package with an Environment

Executing a Package

SSMS

Run package from SQL Server Management Studio, a manual step

SQL Server Agent

Create a job to run on a schedule, automation

SQL Server Agent

Runs with Database engine

Create job and step – use catalog deployment

Schedule time to run

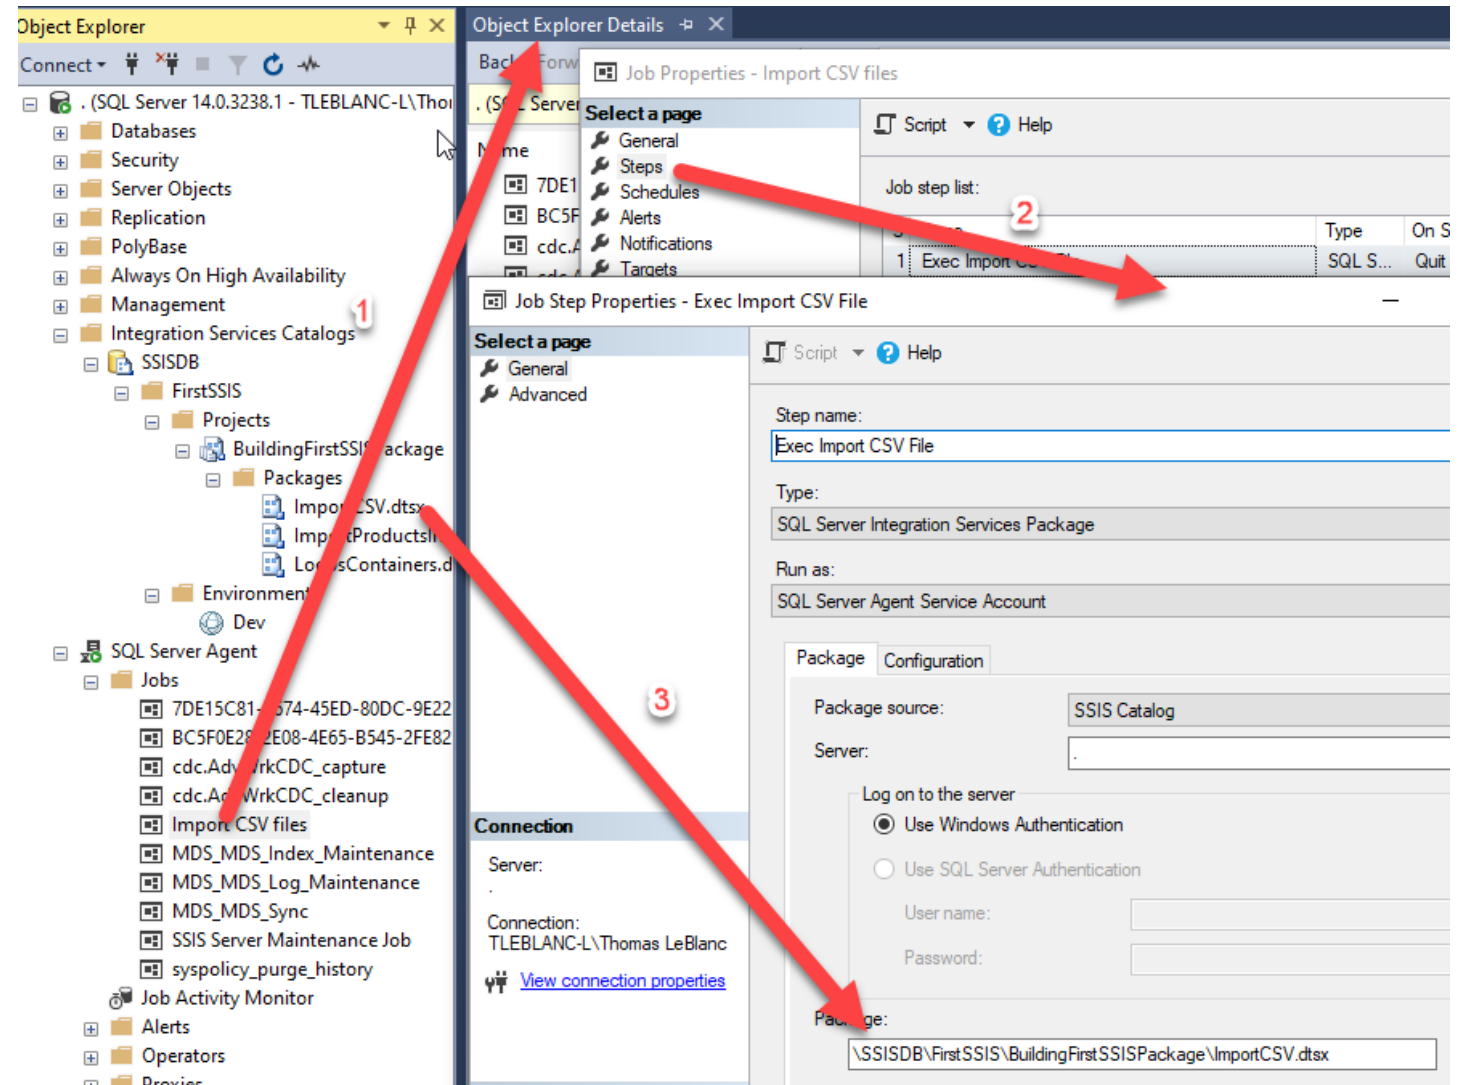

Job is configurable

Set in the job

Relate to environment

Use dashboard to monitor

Demo

Execute job with environment

Summary

Configure and deploy

Use an environment

Capitalized on previous work

Altogether in agent job

Building first package

- More than meets the eye
- SSIS is powerful

Summary

Start to finish

Connection, source, and destination

Shared connections and parameter

Sorted through available components

Understand control versus data flows

Now use to solve business opportunities

- ETL – extract, transform and load
- Configure and monitor
